PREFACE

The essential elements of a neat and clean city are underground drainage, adequate water supply, solid waste management, storm water drains, roads etc., which go a long way in ensuring better built environment and health of human beings. Cities without a proper drainage system face problems of inundation on roads, streets and by-lanes during rainfall, and the resultant traffic snarls, pollution, insanitary conditions, and spread of various water-borne diseases. The Report of the World Health Organisation (WHO) titled “Safe Water, Better Health (2008)” states that about 7.5% of deaths in India are due to water and sanitation related causes. It also highlights that 88% of the cases of diarrhoea world-wide are attributed to unsafe water, inadequate sanitation or improper hygiene.

The report of the WHO Commission on Social Determinants of Health (2008) has emphasized that access to clean water and sanitation should be considered as part of human rights. According to this Report, about one billion people in the world live in slums without basic services. Considering the importance of sanitation in view of its impact on human health, the provision of sanitation facilities for the increasing population in India’s cities and towns is an issue which demands special and immediate attention. The Jawaharlal Nehru National Urban Renewal Mission and other programmes aim at 100% sanitation coverage in the urban areas. The Eleventh Five Year Plan (2007-12) targets to achieve universal sanitation coverage in the country by 2012. A closed drainage system in a city with proper maintenance will go a long way in making it a “healthy” city. However, drainage, in itself, is not enough. What is more important is that all the households should have connectivity, as it is one of the important determinants of quality of life.

What is the scenario in India? How many households in cities and towns have access to closed drainage system and how many have open or no connectivity? The instant document provides data on these aspects. The analysis carried out in the

document is based on the data of Census of India, 2001, which, *inter alia*, provides statistics pertaining to distribution of households by availability of type of drainage connectivity for wastewater outlet. The drainage connectivity has been classified into three types, viz., 'closed drainage', 'open drainage' and 'no drainage'. The census data does not include institutional households.

This document is the outcome of painstaking work put in by Shri J. Nagarajan, Senior Social Scientist, assisted by S/Shri B.K. Bharti, P.P. Tuteja and T. Tete.

I hope that this document will be useful for policy-makers, administrators, planners, researchers and academicians.

CHAPTER I

Households With 'Closed Drainage' Facilities

The absolute number and the percentage of households having connectivity to closed drainage for waste water outlet, in the cities and towns of India, as per the Census of India, 2001; can be seen in the Annexure. The important findings pertaining to the number of households having connectivity to closed drainage for waste water outlet, are given below :

- I. **Percentage range of households having connectivity to closed drainage for waste water outlet : 0 – 99.91%**
- II. **Cities / towns where the proportion of households having connectivity to closed drainage for waste water outlet is either 90 % or more :**

S.No.	Name of town	State / U.T	%
1	Jawaharnagar (Guj. Refnry)	Gujarat	99.91
2	Ramachandrapuram (BHEL)Township	Andhra Pradesh	99.90

CHAPTER IV

Concepts and Definitions

1. Urban Areas

In the Census of India 2001, the definition of urban area adopted is as follows:

- a. All places with a municipality, corporation, cantonment board or notified town area committee, etc.
- b. A place satisfying the following three criteria simultaneously:
 - i. a minimum population of 5,000;
 - ii. at least 75 per cent of male working population engaged in non-agricultural pursuits; and
 - iii. a density of population of at least 400 per sq. km. (1,000 per sq. mile).

For identification of places which would qualify to be classified as 'urban' all villages, which, as per the 1991 Census had a population of 4,000 and above, a population density of 400 persons per sq. km. and having at least 75 per cent of male working population engaged in non-agricultural activity were considered.

2. Household

A 'household' is usually a group of persons who normally live together and take their meals from a common kitchen unless the exigencies of work prevent any of them from doing so. Persons in a household may be related or unrelated or a mix of both. However, if a group of unrelated persons live in a census house but do not take their meals from the common kitchen, then they are not constituent of a common household. Each such person was to be treated as a separate household. The important link in finding out whether it was a household

or not was a common kitchen. There may be one member households, two member households or multi-member households.

3. Institutional Household

A group of unrelated persons who live in an institution and take their meals from a common kitchen is called an Institutional Household. Examples of Institutional Households are boarding houses, messes, hostels, hotels, rescue homes, jails, ashrams, orphanages, etc. This category of households covers only those households where a group of unrelated persons live in an institution and share a common kitchen.

4. Connectivity of Waste Water Outlet

- i. **Connectivity to Closed Drainage:** A house is considered as having connectivity to closed drainage if it has water outlet connected to a closed drainage to carry away the wastewater generated by the household(s) living in it.
- ii. **Connectivity to Open Drainage:** A house is considered as having connectivity to open drainage if it has water outlet connected to an open drainage to carry away the wastewater generated by the household(s) living in it.
- iii. **No Drainage Connectivity:** A house where wastewater outlet is not connected to any drainage system to carry away the wastewater is included in this category.
