PREFACE

Electricity is the lifeline of modern age. Present-day society cannot function without electricity. Electricity as a vital source of energy is used for endless applications which include transport, heating, lighting, communication, information technology and so forth. Despite its indispensability, there are millions of people in the world today who do not have access to this wonderful and versatile form of energy. This definitely calls for increasing generation of electricity in a major way by using all sources, including nuclear, to meet the present as well as the future demands. As per the International Energy Agency, about 1.6 billion people in the world, that is about one-fourth of the world's population (2002), have no access to electricity. Eighty percent of the people who have no access to electricity live in the rural areas of the developing world, mainly in South Asia and sub-Saharan Africa. Without adequate power, both in terms of quantity and quality, it will be impossible to improve the quality of life of people. Lack of access to electricity remains the clearest indicator of fuel-poverty – and, indeed, of poverty in general.

What is the scenario in India, especially in urban settlements, with regard to access of households to electricity? Do all the urban households have access to electricity? What is the variation between cities and towns? It is to answer these questions, the instant document, which is based on the data of Census of India, 2001; has been brought out. The document gives town wise distribution of households by source of lighting and also carries brief analysis of the same. The sources of lighting covered in the Census are electricity, kerosene, solar energy and 'other sources'. It has to be noted here that the Census data does not include institutional households.

I would like to place on record my appreciation of Shri J. Nagarajan, Senior Social Scientist and his team of officers consisting of Shri B.K. Bharti, Senior Research Officer, Shri K.L. Buttan, Research Officer, Shri C.A. Lokesh, Shri P.P. Tuteja and Shri T.Tete for bringing out this document. The secretarial assistance was rendered by Smt. Amarjeet Kaur.

I hope that the information / data contained in the document will be immensely useful for administrators, policy-makers, planners, academicians and researchers.

CHAPTER V

Concepts and Definitions

1. Urban Areas

In the Census of India 2001, the definition of urban area adopted is as follows:

- a. All places with a municipality, corporation, cantonment board or notified town area committee, etc.
- b. A place satisfying the following three criteria simultaneously:
 - i. a minimum population of 5,000;
 - ii. at least 75 per cent of male working population engaged in non-agricultural pursuits; and
 - iii. a density of population of at least 400 per sq. km. (1,000 per sq. mile).

For identification of places which would qualify to be classified as 'urban' all villages, which, as per the 1991 Census had a population of 4,000 and above, a population density of 400 persons per sq. km. and having at least 75 per cent of male working population engaged in non-agricultural activity were considered.

2. Household

A 'household' is usually a group of persons who normally live together and take their meals from a common kitchen unless the exigencies of work prevent any of them from doing so. Persons in a household may be related or unrelated or a mix of both. However, if a group of unrelated persons live in a census house but do not take their meals from the common kitchen, then they are not constituent of a common household. Each such person was to be treated as a separate household. There may be one member households, two member households or multi-member households.

3. Institutional Household

A group of unrelated persons who live in an institution and take their meals from a common kitchen is called an Institutional Household. Examples of Institutional Households are boarding houses, messes, hostels, hotels, rescue homes, jails, ashrams, orphanages, etc. This category of households covers only those households where a group of unrelated persons live in an institution and share a common kitchen.

4. Source of lighting

In the Census of India , 2001 information on the source of lighting in the houses occupied by the households was collected on six sources. These are: Electricity, Kerosene, Solar, Other oil, Any other and No lighting. The actual source of lighting used for greater part of the year was collected for each household.
